TITLE : OPTICAL INFORMATION MEDIUM
HAVING MULTILAYERED STRUCTURE

ABSTRACT : PROBLEM TO BE SOLVED: To make it possible to inexpensively produce the above optical information medium and to increase its capacity by adopting a structure formed by sticking optical information media respectively having ≥ 2 to ≤ 4 information surfaces on two substrates in such a manner that these substrates face outward.

SOLUTION: This optical information medium has the plural reproduction-only information surfaces and at least one recordable information surface on the substrates 1, 1' consisting of polycarbonate, etc. The optical information media which respectively have the ≥ 2 to ≤ 4 information surfaces on the substrates 1, 1', consist of materials transparent to light beams and having a thickness of ≥ 30 to $\leq 60\mu\text{m}$ between these information surfaces and are different from each other are stuck to each other by an inner side adhesive layer 6' in such a manner that the substrates 1, 1' face outward. In such a case, the large-capacity information recording medium having the capacity per optical information medium of 4 to 8 times the capacity of the single plate single surface medium structure.
